

Safe-turn[®] with AIRBAR[™]

THE PROBLEM: Almost no reduction globally in serious or fatal injuries to cyclists and pedestrians by heavy vehicles turning at junctions over the last 5 years, despite the introduction of numerous in-cab driver warning systems including much improved mirror blind-spot design, short range radar and audible warnings.

WHY NO REDUCTION? Perhaps an automatic device that visually **warns the cyclists** that a heavy vehicle is about to turn could be the key?

A SOLUTION . . .

Safe-turn with AirBar[™], a wonderfully simple British invention. 

A soft inflatable **highly visible** inflatable 'arm' that automatically deploys when the left turn indicator is used at speeds under 15mph.

It is bright orange and has **FLASHING LEDs**.

It then automatically retracts when the left turn indicator is cancelled.

Simple. Safe. British. Safe-turn[®] by AIRBAR[™] sales@nuvech.co.uk
